A measurable next step in ALS research

ONQIVA seeks a host lab and seed support to test whether early motor-neuron recovery after brief stress predicts the response to a second challenge better than a single image.

Publications and analysis	ALS recovery prediction	Host lab and seed support

RESEARCH RECORD

Published: First-author vitamin D and cancer review (PMID 37054849); coauthored osteosarcoma mechanisms paper (DOI 10.3389/fonc.2023.1188641).

Bench: Hands-on protein research and earlier incubator-based culture work. Original culture assay records are being reconstructed; no prior ALS cell result is claimed.

Modeling: Hand-worked mathematics carried into a reproducible NHANES survival analysis (515 adults, 35 observed deaths), with code and limitations public.

THE PROPOSED TEST

Published C9orf72 motor-neuron research (PMCID PMC10996466) reports impaired TDP-43 recovery after repeated mild injury. ONQIVA's proposed contribution is a prespecified prediction test: can a recovery curve forecast later TDP-43 localization and cell health in held-out cultures better than a baseline snapshot?

If the dynamic measure adds no value across independent lines, that proposed marker fails its key test. This study would not establish a patient test or treatment.

WHAT SUPPORT WOULD ENABLE

01 **Assay feasibility**
Set a reproducible, nonlethal stress-and-recovery imaging protocol in a motor-neuron-like culture. Deliver: protocol and quality criteria.

02 **Human-cell comparison**
Compare C9orf72 iPSC-derived motor neurons with isogenic controls across independent differentiations. Deliver: recovery curves and uncertainty.

03 **Held-out prediction**
Lock the model and compare recovery-based versus snapshot-based forecasts on independent cultures. Deliver: blinded result, including null findings.

THE PARTNERSHIP REQUEST

A qualified ALS lab, a quantitative reviewer, and seed support for personnel time, cell models, reagents, imaging, and reporting. The host institution would finalize the budget and schedule. The funder receives a protocol, analysis, and decision report whether the prediction succeeds or fails.
